

ABSTRACT OF THE DISCLOSURE

A method and system for predicting server database requests by a client. A database contains a plurality of command sets likely to be sent by a client to a server. The server compares statements received from the client with command sets stored in the database. If the server recognizes a pattern with a command set stored in the database, the server predicts that the client will send this command set and executes the statements contained therein.

Case	Initial condition	Final condition	Time (s)	Time (min)	Time (h)
1	0.001	0.001	0.001	0.001	0.001
